mammals	Warm blooded animals with hair and vertebrates.
birds	A warm blooded egg-lying vertebrate.
reptiles	A cold blooded vertebrate that moves or slides on their belly.
amphibians	A cold blooded invertebrate that can live in both land and water.
hatchling	A young animal that has recently emerged from its egg.
pregnancy	The time between a baby is made and born.
egg	The female reproductive cell
spawn	The term used to describe eggs in water.

Threshold Concept

Animals	A living thing that eats plants or other animals.
Growth and Life	The process in which cells inside living things increase in size and number.
Humans	A mammal person.

Key Facts

- To survive all animals including humans need water, food and air to survive.
- Animals including humans have offspring but they can have them in different ways.
- Amphibians lay eggs which can then be fertilized, mammals give birth to babies, whilst reptiles and birds lay fertilized eggs.
- As animals and humans get older they change through a life cycle.
